

# Experiment 10

**Student Name:** Muskan

**UID:**23BAI70172

**Branch:** BE-AIT-CSE

**Section/Group:**23AML-1(A)

**Semester:**5<sup>th</sup>

**Date of Performance:**29 Oct,2025

**Subject Name:**ADBMS

**Subject Code:**23CSP-333

## Aim:

To study and perform basic CRUD (Create, Read, Update, Delete) operations in **MongoDB**, a NoSQL document-based database, and understand its key commands, such as creating databases, collections, inserting, updating, deleting records, and grouping data using aggregation.

## Objective:

- To understand the concept of NoSQL and document-based databases.
- To learn how to create and manage databases and collections in MongoDB.
- To perform CRUD operations — Create, Read, Update, and Delete — on MongoDB collections.
- To use operators like \$push, \$pull, \$unset, and \$upsert for document updates.
- To execute conditional queries and retrieve nested document data using find().
- To perform grouping and aggregation operations using \$sum and other aggregation operators.
- To compare SQL and NoSQL databases in terms of structure, performance, and use cases.
- To apply MongoDB commands on a practical dataset (e.g., car dealership data) for hands-on understanding.

## Theory:

MongoDB is a NoSQL document-oriented database that stores data in JSON-like documents instead of tables and rows. It is designed for handling large, unstructured, or semi-structured data with flexibility and scalability.

A **MongoDB database** contains **collections**, and each collection holds multiple **documents** made up of key-value pairs. Unlike SQL databases, MongoDB allows documents in the same collection to have different structures, making it ideal for applications with changing data requirements.

### Basic Operations:

- **Create:** use db\_name, db.createCollection()
- **Insert:** insertOne(), insertMany()
- **Read:** find(), findOne()
- **Update:** updateOne(), updateMany() with \$set, \$push, \$pull, \$upsert
- **Delete:** deleteOne(), deleteMany()

MongoDB also supports **aggregation** (e.g., \$sum, \$group) for analyzing and summarizing data.

### Advantages:

- Flexible and schema-less structure
- High performance and scalability
- Easy integration with modern applications

In short, MongoDB is preferred for applications requiring **speed, flexibility, and scalability**, while SQL remains suited for **structured and relational data**.

## Procedure:

- Start the MongoDB server and open the Mongo shell or MongoDB Compass.
- Create or switch to a new database.
- Create a new collection to store data.
- Insert one or more documents into the collection.
- Retrieve data from the collection using read operations.
- Apply filters or conditions to view specific data.
- Update existing records in the collection as required.
- Delete one or multiple records from the collection.
- Perform grouping or aggregation operations to analyze data.
- Drop collections or the entire database if no longer needed.

Code:

```
db.createCollection("cars")

db.cars.insertOne({  
  
    "maker": "Tata",  
  
    "model": "Nexon",  
  
    "fuel_type": "Petrol",  
  
    "transmission": "Automatic",  
  
    "engine": {  
  
        "type": "Turbocharged",  
  
        "cc": 1199,  
  
        "torque": "170 Nm"  
  
    },  
  
    "features": [  
  
        "Touchscreen",  
  
        "Reverse Camera",  
  
        "Bluetooth Connectivity"  
  
    ],  
  
    "sunroof": false,  
  
    "airbags": 2  
})  
  
db.cars.find().pretty()  
  
db.cars.insertMany([{"maker": "Tata", "model": "Nexon", "fuel_type": "Petrol", "transmission": "Automatic", "engine": {"type": "Turbocharged", "cc": 1199, "torque": "170 Nm"}, "features": ["Touchscreen", "Reverse Camera", "Bluetooth Connectivity"], "sunroof": false, "airbags": 2}, {"maker": "Hyundai", "model": "Creta", "fuel_type": "Diesel", "transmission": "Manual", "engine": {"type": "CRDi", "cc": 1493, "torque": "250 Nm"}, "features": ["Sunroof", "ABS", "Touchscreen"], "sunroof": true, "airbags": 6}, {"maker": "Maruti", "model": "Swift", "fuel_type": "Petrol", "transmission": "Manual", "engine": {"type": "Naturally Aspirated", "cc": 1197, "torque": "113 Nm"}, "features": ["Bluetooth Connectivity", "Power Windows"], "sunroof": false, "airbags": 2}])
```

```
db.cars.find()  
db.cars.findOne()  
db.cars.find({}, { model: 1, _id: 0 })  
db.cars.find({ "fuel_type": "Petrol" })  
db.cars.updateOne(  
  { model: "Nexon" },  
  { $set: { color: "Red" } }  
)  
  
db.cars.find({ model: "Nexon" }).pretty()  
  
db.cars.updateOne(  
  { model: "Nexon" },  
  { $push: { features: "Heated Seats" } }  
)  
  
db.cars.find({ model: "Nexon" }).pretty()  
  
db.cars.updateOne(  
  { model: "Nexon" },  
  { $pull: { features: "Heated Seats" } }  
)  
  
db.cars.find({ model: "Nexon" }).pretty()  
  
db.cars.updateMany(  
  { fuel_type: "Diesel" },  
  { $set: { alloys: "yes" } }  
)  
  
db.cars.find({ fuel_type: "Diesel" }).pretty()  
  
db.cars.updateOne(  
  { model: "Nexon" },
```

```
{ $push: { features: { $each: ["Wireless charging", "Voice Control"] } } }
```

)

```
db.cars.find({ model: "Nexon" }).pretty()
```

```
db.cars.updateOne(
```

```
  { model: "Nexon" },
```

```
  { $unset: { color: "" } }
```

)

```
db.cars.find({ model: "Nexon" }).pretty()
```

```
db.cars.aggregate([
```

```
  {
```

```
    $group: {
```

```
      _id: "$maker",
```

```
      TotalCars: { $sum: 1 }
```

```
    }
```

```
  }
```

])

```
db.cars.aggregate([
```

```
  {
```

```
    $group: {
```

```
      _id: "$fuel_type",
```

```
      TotalCars: { $sum: 1 }
```

```
    }
```

```
  }
```

])

Output:

```
test> db.createCollection("cars")
{ ok: 1 }
test> db.cars
test.cars

## **7. Learning Outcomes:**

- Understand the concept of **NoSQL databases** and their differences from SQL databases.
- Gain knowledge of **MongoDB architecture**, including databases, collections, and documents.
- Learn to perform **CRUD operations** (Create, Read, Update, Delete) using MongoDB commands.
- Use operators such as `$set`, `$push`, `$pull`, `$unset`, and `$upsert` for data manipulation.
- Apply **aggregation and grouping operations** using operators like `$sum`, `$avg`, `$min`, and `$max`.
- Develop the ability to query and analyze data efficiently in MongoDB.
- Compare the advantages and use cases of **SQL vs NoSQL** database models.
- Gain practical experience handling real-world data (e.g., car dealership dataset) using MongoDB.
